
The PaveDrain system is a Permeable Articulating Concrete Block (P-ACB) that is designed as an open joint concept between the blocks, which creates a significant infiltration rate. If the joints become filled or obstructed, maintenance is accomplished by using a vacuum truck or combination sewer truck and the PaveDrain Vac Head.

NOTE: The PaveDrain blocks DO NOT have rock swept into the joints.

Existing PaveDrain installations can easily be retrofitted with the P4 INFIL-Tracker Monitoring system.

The INFIL-Tracker monitoring system autonomously measures the water level under the PaveDrain system before, during and after a storm event. Measure runoff volume captured and infiltration rate to drive data-driven TMDL compliance and document maintenance requirements.
